

# Angular Test

---

1. Create an angular (version 11) application using *ng-cli* (NO router and SCSS as styles preprocessor).
2. Use this *API end-point* to get data about pokemons (only first 15 results are needed):
  - <https://pokeapi.co/api/v2/pokemon>
3. Show data as a list:

4. Show the pokemon details when user clicks a name using this *API end-point*:
  - <https://pokeapi.co/api/v2/pokemon> + pokemon name (f.i.: <https://pokeapi.co/api/v2/pokemon/ditto>)

5. Use the 'Pokemon list' title to go back to pokemon list.

NOTE: You can explore the pokemon API data on this [link](#).
